**Statement on the Northern Ireland
Peace Process**

May 5, 2000

I am greatly encouraged that Prime Ministers Blair and Ahern have announced that their intensive talks in Belfast over the past 2 days have made progress, providing a sound basis for restoring the political institutions and achieving full implementation of the Good Friday accord. I urge the parties and paramilitary organizations to seize this opportunity to realize these goals in order to secure lasting peace for the people of Northern Ireland. The United States remains prepared to assist in any way we can.

NOTE: In his statement, the President referred to Prime Minister Tony Blair of the United Kingdom; and Prime Minister Bertie Ahern of Ireland. This item was not received in time for publication in the appropriate issue.

**Proclamation 7304—Global Science
and Technology Week, 2000**

May 5, 2000

*By the President of the United States
of America*

A Proclamation

At its core, science is an international endeavor. The fundamental workings of nature—the function of a gene, the quantum behavior of matter and energy, the chemistry of the atmosphere—are not the sole province of any one nation. At the same time, many of the greatest challenges our Nation faces are of global concern. Issues such as poverty, disease, pollution, and sustainable energy production transcend national boundaries, and their solutions require international collaboration. With the advent of the Internet and the revolution in communications technology, such cooperation is more achiev-

able—and more productive—than ever before.

In recent years, America has participated in numerous scientific endeavors that illustrate the feasibility and the benefits of international cooperation. For example, as one of 16 participating nations, we are advancing the frontiers of space exploration through a partnership to build the International Space Station. Working together in the unique environment of space, we will strive to solve crucial problems in medicine and ecology and lay the foundations for developing space-based commerce.

We are also participating in an international scientific effort to map and sequence all human chromosomes. With the completion of the Human Genome Project, we will have unprecedented knowledge about the cause of such genetic diseases as muscular dystrophy and Alzheimer's and greater hope of preventing them in the future.

Since the 1980s, under the auspices of the United Nations Environment Program and the World Meteorological Organization, American scientists have been working with hundreds of scientists around the world to identify, understand, and raise public awareness about the threat to our planet's ozone layer. Our collaborative efforts have led to an international agreement to eliminate nearly all production of offending chemicals in industrialized countries and to work to reduce their production in developing countries.

Our Nation continues to reap rewards from these and other important international scientific efforts. We benefit enormously from the large and growing international scientific community within our borders. For generations, the world's brightest scientists have come to our country to study and conduct research, and many choose to remain here permanently. From Albert Einstein to four of this year's Nobel laureates, foreign-born scientists in America have made

extraordinary contributions to science and technology and have played a vital role in the unprecedented prosperity and economic growth we have experienced in recent years.

The great French scientist Louis Pasteur noted more than a century ago that “science knows no country, because knowledge belongs to humanity, and is the torch which illuminates the world.” During Global Science and Technology Week, America joins the world community in celebrating the immeasurable benefits we have enjoyed from international scientific collaboration and looks forward to a future of even greater achievements.

Now, Therefore, I, William J. Clinton, President of the United States of America, by virtue of the authority vested in me by the Constitution and laws of the United States, do hereby proclaim May 7 to May 13, 2000, as Global Science and Technology Week. I call upon students, educators, and all the people of the United States to learn more about the international nature of science and technology and the contributions that international scientists have made to our Nation’s progress and prosperity.

In Witness Whereof, I have hereunto set my hand this fifth day of May, in the year of our Lord two thousand, and of the Independence of the United States of America the two hundred and twenty-fourth.

William J. Clinton

[Filed with the Office of the Federal Register, 8:45 a.m., May 10, 2000]

The President’s Radio Address

May 6, 2000

Good morning. Warm weather has finally taken hold in most of the country, and millions of families are now taking weekend picnics and hosting backyard barbecues. Today I want to speak with you about the foods we serve at these gatherings and how we can make them even safer than they already are.

Our food supply is the most bountiful in the world. And for 7 years now, our administration has been committed to making it the safest in the world. We’ve improved dramatically the Nation’s inspection system for meat, poultry, and seafood. We’ve added new safeguards to protect families from unsafe imported foods. We’ve established a sophisticated early warning system that uses DNA fingerprinting techniques to detect and prevent outbreaks of foodborne illness. From farm to table, we’ve made great strides to ensure the safety of our food supply. But outbreaks of food-related illnesses are still far too prevalent. In fact, millions of Americans get sick from eating contaminated food each year.

One threat we must address immediately comes from a foodborne pathogen called *Listeria*, which has been the cause of recent recalls of hot dogs and luncheon meats and several deadly outbreaks of disease. The most famous case emerged a year and a half ago, when *Listeria* killed 21 people and sickened 100 others, all of whom had eaten contaminated meat from a single plant. It was the Nation’s most deadly food safety epidemic in 15 years.

Fortunately, *Listeria* is less common than *salmonella*, *E. coli*, and other foodborne bacteria, but unfortunately, it is far more dangerous. A staggering 20 percent of *Listeria* infections result in death. As with other foodborne bacteria, it’s rarely healthy adults who come down with *Listeria* infections. Instead, it’s the most vulnerable among us: infants, the elderly, pregnant women, and those whose immune systems have been weakened by chemotherapy or AIDS.

While our administration has already taken a number of important steps to reduce the threat of *Listeria*, it’s clear we must do more to protect Americans from this deadly pathogen. So today I’m directing the Departments of Agriculture and Health and Human Services to prepare an aggressive new strategy to significantly reduce the risk of illness from *Listeria*. As part of this strategy, we will propose new regulations to require scientific
